ABSTRACT

This study presents the development of iSECTION: A Decision Support System for BSIT Freshmen Sectioning at J.H. Cerilles State College. The system was created to solve problems in the current sectioning process of students, which is slow, manual, and sometimes inaccurate. The existing system does not fully meet the needs of the BSIT program, causing delays and extra work for faculty and staff. The main goal of this project is to develop a web-based system that can automatically check exam scores, rank students, and assign them to the correct sections based on their performance. The system also allows students to easily view their results and section assignments online, while helping staff manage the process more efficiently. The system was developed using the 4D method: Define, Design, Develop, and Deploy. It was built using PHP, JavaScript, HTML, and MySQL to ensure it is simple, reliable, and easy to use. Different tests were conducted, including alpha, beta, load, and usability testing, and the results showed that the system works properly and is user-friendly. The results of the study show that the system improves the speed and accuracy of sectioning, reduces manual work, and helps in making better decisions based on data. Users also found the system easy to learn and use. In conclusion, the iSECTION system provides a faster, easier, and more organized way of assigning BSIT freshmen to sections. It is recommended for use in the school and can be improved further by adding features like notifications and manual adjustments for special cases.
